

Resume of Lecture by Pr. Bob Gallager from MIT Massachusetts Institute of Technology (MIT)

George Boole (1815-1864) developed Boolean logic

The principles of logical thinking have been understood (and occasionally used) since the Hellenic era.

Boole's contribution was to show how to systemize these principles and express them in equations (called Boolean logic or Boolean algebra).

Claude Shannon (1916-2001) showed how to use Boolean algebra as the basis for switching technology. This contribution systemized logical thinking for computer and communication systems, both for the design and programming of the systems and their applications.

Logic continues to be abused in politics, religion, and most non-scientific areas.

Logic continues to be abused in politics, religion and most non-scientific areas

Kant

Gauß

Goethe

A little nationalistic, but this is an sample of right logic

Kant, Gauss, Goethe are great

Kant, Gauss, Goethe - Germans

Germany Great

Bad logic (abuse of logic)

The Mathematical Theory of Communication

Creating a reliable connection over an unreliable (noisy) channel that's what IT is about

and that's what Shannon did

from to fin Grade. 

Massachusetts Institute of Technology (MIT)

Boolean logic

↓

Modern mathematical system that works with True or false using (1) (0)
And, or, nor, used in computers for processing info

Aristotelian logic was old system based on reasoning with words and categories (all men are mortal)

$$P(A) = \frac{n_1! - n_2!}{n!} - \text{Bin. distribution}$$

Arrangements are indistinguishable in objects

$$H = \sum_{x=1}^n p(x) \log_2 \left(\frac{1}{p(x)} \right)$$

$$I(x) = \log_2 \left(\frac{1}{p(x)} \right) - \text{qualifying information}$$

$$H(x) = \sum_{x=1}^n p(x) H(x)$$

$$\log_2 \left(\left(\frac{1}{8} \right)^{-1} \right) = 3 \quad \log_2 \frac{1}{0,5} = 1$$

□□□□	0,5
